

Pycaret Assignment

❖ **Binary Classification**

❖ **Kaggle Notebook :- [Link](#)**

❖ **Submitted By :- Dev Mulchandani**

❖ **Overview :-**

In my binary classification notebook, I used PyCaret's classification module to predict outcomes with two possible classes — for example, whether a passenger survived or not in the Titanic dataset. After loading and exploring the data, I initialized PyCaret using the `setup()` function, which automatically handled data preprocessing, encoding, and splitting. Then, I compared multiple classification models with `compare_models()` and selected the best one based on accuracy and F1-score. Finally, I evaluated the chosen model using visual plots, made predictions on the test data, and saved both the trained model and the results. This workflow demonstrated how binary classification can be done easily and efficiently using PyCaret with minimal code.

PyCaret Classification — Kaggle

For Kaggle: use **Add data** to attach a dataset. CSV files appear under `/kaggle/input/...`. Run the first cell to install PyCaret 3.3.2.

Assignment Done by :- **Dev Mulchandani**

```
[1]: %pip -q install -U pip
      %pip -q install 'pycaret==3.3.2'
      import sys
      print('Python:', sys.version)
```

```
[2]: import glob, pandas as pd
      csvs = sorted([p for p in glob.glob('/kaggle/input/**/*.csv', recursive=True)])
      if not csvs:
          raise SystemExit('No CSVs found under /kaggle/input. Click **Add data** and attach your ')
      for i,p in enumerate(csvs):
          print(f'{i}: {p}')
      idx = int(input('Enter the index of the CSV to load: '))
      DATA_PATH = csvs[idx]
      print('Using:', DATA_PATH)
      data = pd.read_csv(DATA_PATH)
      print('Shape:', data.shape)
      display(data.head())
```

0: /kaggle/input/test-titanic/test.csv
1: /kaggle/input/titanic/train_and_test2.csv
2: /kaggle/input/train-titanic/train.csv
Enter the index of the CSV to load: 2
Using: /kaggle/input/train-titanic/train.csv
Shape: (891, 12)
